Subject	Mobile screening unit: posting for 15 June to 31 August 2027

Post the unit to Halloran Bay: it moves 382,700 passengers within the 20-minute standard this summer, against 237,700 at Cullinvale

Posted to Halloran Bay from 15 June to 31 August, the unit would move 382,700 passengers through screening within the 20-minute standard who would otherwise wait longer. The next best posting, Cullinvale, would move 237,700; every other airport less.

On the summer roster patterns with the unit's three lanes added, Cullinvale would come first and Halloran Bay fifth. That is not what a posting adds. In every posting week last summer the host's duty managers stood down lanes of their own while the unit screened: at seven of the eight airports two lanes for the whole of the unit's day, and more in the quieter hours after the banks, so the unit added one lane at their banks, not three. Halloran Bay kept all five of its lanes open through both banks and stood its officers down only once each bank was over. With the new based operator's first full summer its banks are the heaviest against its lanes of the eight, and the unit's three lanes bring every passenger there within the standard.

Spread evenly over the unit's day, Halloran Bay's stand-down looks like a little over two lanes and Eskerford comes out ahead; but Halloran Bay releases four lanes for almost nine hours a day and none of them while its queues build, so the figures here take each host's stand-down interval by interval, as the lane counts show it.

Design days of Capacity Planning's summer 2027 planning sheet, each standing for every day of its period, run through KAS-STD-07 sections 4 and 6.

How far the forecast can fall. Halloran Bay stays the better posting unless its forecast passengers fall short by 14 per cent or more across the summer, the smallest whole per cent shortfall at which a posting at Cullinvale would move more.

Passengers the unit would move within the standard over the summer, by posting

Posting	Host's own lanes stood down through its banks, 2026	Lanes the unit adds at the banks	Passengers moved, 15 June to 31 August 2027
Halloran Bay	**0**	**3**	**382,700**
Cullinvale	2	1	237,700
Eskerford	2	1	195,200
Faranloe	2	1	187,200
Brennagh	2	1	186,300
Dromkeel	2	1	184,100
Ardcarrig	2	1	180,900
Glenkessan	2	1	166,600

Nearest hundred, from unrounded counts. Every host also stood down more lanes in the quieter hours after its banks, which leaves the passengers moved unchanged.

Last summer at each airport

Airport	Passengers screened, 15 June to 31 August 2026	Hotel cost per officer-night, EUR	Posting weeks	Expense claims per posting week, EUR
Halloran Bay	**616,000**	**112.98**	**1**	**8,091.04**
Cullinvale	1,299,100	116.72	2	7,135.92
Eskerford	890,200	98.50	1	8,163.34
Faranloe	1,058,700	90.30	1	7,991.56
Brennagh	757,600	84.70	1	8,247.46
Dromkeel	866,300	95.40	1	8,824.96
Ardcarrig	1,125,900	110.01	3	7,339.69
Glenkessan	641,000	93.73	1	8,724.60

Passengers screened: the checkpoint's passenger lanes and the unit's lanes while it was there; the staff and aircrew searched at the shift changes are not passengers. Hotel cost: every invoice and credit note on the posting's purchase order, as paid, over the officer-nights stayed. Claims: each claim line once, each claim with the posting it was made for, travel to and from the posting included.

Method

Each checkpoint's lanes with the unit there are its summer 2027 roster pattern, less the lanes its duty managers stood down in each 15 minutes of every posted day last summer (the 2026 lane counts against the summer 2026 roster pattern), plus the unit's three lanes from 05:00 to 21:00. The stand-down was the same on every posted day at every host, Ardcarrig's two weeks running included. The passengers moved are those outside the standard on the roster pattern alone less those outside it with the unit, on each design day, times the days in the period (16, 31 and 31).

At the other seven airports the unit's posting moves fewer passengers than at Halloran Bay in every period, because one lane at the banks is all it adds there.
