Seven zones' wasting figures carry the measurement note

Seven of the twelve zones' long-rains wasting figures carry the measurement note: North Pastoral, North Lakeshore, Central Pastoral, Laga Town, East Pastoral, West Pastoral and West Riverine. In each, the figure from the MUAC readings and the figure from the children's own arm circumference differ by 2.0 points or more (North Pastoral +4.0, North Lakeshore +4.1, Central Pastoral -3.8, Laga Town +5.2, East Pastoral +5.1, West Pastoral +2.9 and West Riverine +4.5), so under protocol section 7 the zone goes into the bulletin at its children's own figure, marked with the note. The other five zones go in at their readings' figure, without the note.

Two kinds of error move the readings. Six anthropometrists read 2.1 to 4.0 mm off the supervisor at the standardisation sessions (a tight or loose pull), which shifts the whole zone; three others (Steve Abdikadir, Joan Bashir and Cosmas Kibet) repeat their own reading of a child closely (repeat error 1.7, 1.2 and 1.0 mm) but depart from the supervisor child to child by 5.8, 5.1 and 6.3 mm, which widens the zone's spread and puts more children on either side of 125 mm. Each reading is corrected by its anthropometrist's offset, and the spread by the variance of its single readings' departures from the supervisor about that offset; the test's repeat error alone would miss the second kind and note four zones.

Central Pastoral's anthropometrist pulls the tape loose, so its readings understate wasting: its children's own figure is 10.8 per cent against 7.0 from the readings. The response and death rates for the annex are in the workbook.

Note: the two figures differ by 2.0 points or more (protocol v2.1, section 7). Bands: section 8.
Source: NCHA and PRK anthropometry and standardisation, long-rains round 2027.

Acute malnutrition by MUAC, children 6 to 59 months: MUAC below 125 mm read from the normal distribution, bilateral oedema counted (protocol sections 6 and 7). Own arm circumference: each reading less its anthropometrist's offset against the supervisor, the spread less the variance of the anthropometrist's departures from the supervisor about that offset; ranges in the workbook.
